

Z250H FOG-ceptor®

Test After Test, It Measures Up

You have a lot on your plate when it comes to running your establishment. New regulations in your county? That's just another stressor to pile on it.

Here are the facts. Miami-Dade County and its municipalities must correct existing FOG problems under Federal Court Order, effective immediately. Food service establishments are required to install a system that meets 100 parts per million FOG removal.

Failure Is Not an Option

Miami-Dade County isn't singling out its valuable businesses. Most counties across the country require 99% removal efficiency. The goal is to keep fats, oils and grease from entering our wastewater, backing up our systems, and contaminating groundwater in our communities. Zurn's FOG-ceptor captures FOG with consistent results.

Passed Three Times Over

Our engineers worked with NSF, a well-recognized third-party certifier, to put our FOG-ceptor to the ultimate test. For PDI G-101 certification, at least 15 sink dumps are required. Per load capacity, we used two FOG-ceptor Z250H in series. The systems surpassed 45 sink dumps, while continuously delivering over 99% FOG removal efficiency and meeting the 150 parts per million FOG removal.

Odds Are in Your Business

The results add up for your business in performance. 45 sink dumps later with well over 99% efficiency, the FOG-ceptor delivers 100% confidence and compliance. What's more? We could have kept testing, but we were already certified three times over.

Trust in Tested

Full compliance. No question. We put FOG-ceptor to the test, so you can put your worries to rest. Choose FOG-ceptor to measure up to regulations and for your business.
