

# Z1035-Q STRUCTURAL DECK DRAIN STABILIZER

Dimensional Data (inches and [mm]) are Subject to Manufacturing Tolerances and Change Without Notice

The Zurn Structural Deck Drain Stabilizer is a unique support plate designed to secure a drain to structural steel roof decks (Q-Deck), and to provide adjustment and rigidity during the drain installation process.

The main objectives for the Structural Deck Drain Stabilizer are as follows:

- (a) To provide a means of pre-assembling the drain to a known rough-in height. If the floor thickness is already known, the drain and Installation Stabilizer can be conveniently pre-assembled away from the job site, and quickly placed and leveled in the correct location at the job site, saving labor costs.
- (b) To locate and secure the drain in place and keep it in position prior to concrete pour. The Installation Stabilizer will help resist the drain from tipping, tilting, or being knocked over during construction and concrete pour.
- (c) To allow height and level adjustments of the drain to meet the finished floor.
- (d) To support any reasonable excess weight that may be placed on the drain before the concrete is poured.
- (e) To allow for easy attachment of the waste line piping after a concrete pour.

## How to Use The Drain Installation Stabilizer

The installation stabilizer is constructed of galvanized steel plate and is designed to be used with 8 3/8" drain body.

Four lengths of all-thread rod are attached to the body by inserting and tightening into the tapped holes located on the underside of the body. The stabilizer plate is then connected to the all-thread rod by use of flanged nuts, above and below the plate. Adjusting the placement of the nuts changes the rough-in height of the drain. Once the proper height is obtained, the nuts are tightened against the plate. Any excess rod is trimmed off and a stub of pipe is then connected to the body and allowed to extend through the center hole of the plate. The assembly is then fastened to the steel roof deck
